Indicator	Value	Description	Source
Overall Basin Risk (score)	3.11	Overall Basin Risk (score)	
Overall Basin Risk (rank)	21	Overall Basin Risk (rank)	
Physical risk (score)	2.92	Physical risk (score)	
Physical risk (rank)	61	Physical risk (rank)	
Regulatory risk (score)	3.26	Regulatory risk (score)	
Regulatory risk (rank)	39	Regulatory risk (rank)	
Reputation risk (score)	3.52	Reputation risk (score)	
Reputation risk (rank)	15	Reputation risk (rank)	
1. Quantity - Scarcity (score)	2.71	1. Quantity - Scarcity (score)	
1. Quantity - Scarcity (rank)	53	1. Quantity - Scarcity (rank)	
2. Quantity - Flooding (score)	3.45	2. Quantity - Flooding (score)	
2. Quantity - Flooding (rank)	81	2. Quantity - Flooding (rank)	
3. Quality (score)	3.18	3. Quality (score)	
3. Quality (rank)	81	3. Quality (rank)	
4. Ecosystem Service Status (score)	2.55	4. Ecosystem Service Status (score)	
4. Ecosystem Service Status (rank)	87	4. Ecosystem Service Status (rank)	
5. Enabling Environment (Policy & Laws) (score)	3.00	5. Enabling Environment (Policy & Laws) (score)	
5. Enabling Environment (Policy & Laws) (rank)	63	5. Enabling Environment (Policy & Laws) (rank)	
6. Institutions and Governance (score)	3.25	6. Institutions and Governance (score)	
6. Institutions and Governance (rank)	67	6. Institutions and Governance (rank)	
7. Management Instruments (score)	2.91	7. Management Instruments (score)	
7. Management Instruments (rank)	86	7. Management Instruments (rank)	
8 - Infrastructure & Finance (score)	4.35	8 - Infrastructure & Finance (score)	
8 - Infrastructure & Finance (rank)	33	8 - Infrastructure & Finance (rank)	
9. Cultural Diversity (score)	5.00	9. Cultural importance (score)	
9. Cultural Diversity (rank)	2	9. Cultural importance (rank)	
10. Biodiversity Importance (score)	3.77	10. Biodiversity importance (score)	

## Country Overview - Nigeria

Indicator	Value	Description	Source
10. Biodiversity Importance (rank)	65	10. Biodiversity importance (rank)	
11. Media Scrutiny (score)	3.00	11. Media Scrutiny (score)	
11. Media Scrutiny (rank)	66	11. Media Scrutiny (rank)	
12. Conflict (score)	3.40	12. Conflict (score)	
12. Conflict (rank)	22	12. Conflict (rank)	
1.0 - Aridity (score)	2.12	The aridity risk indicator is based on the Global Aridity Index (Global-Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geodatabase. CGIAR consortium for spatial information.
1.0 - Aridity (rank)	57	The aridity risk indicator is based on the Global Aridity Index (Global-Aridity) and Global Potential Evapo-Transpiration (Global-PET) Geospatial data sets by Trabucco and Zomer (2009). These data sets provide information about the potential availability of water in regions with low water demand, thus they are used in the Water Risk Filter 5.0 to better account for deserts and other arid areas in the risk assessment.	Trabucco, A., & Zomer, R. J. (2009). Global potential evapo-transpiration (Global-PET) and global aridity index (Global-Aridity) geodatabase. CGIAR consortium for spatial information.
1.1 - Water Depletion (score)	1.49	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. <i>Elem Sci Anth</i> , 4.
1.1 - Water Depletion (rank)	104	The water depletion risk indicator is based on annual average monthly net water depletion from Brauman et al. (2016). Their analysis is based on model outputs from the newest version of the integrated water resources model WaterGAP3 which measures water depletion as the ratio of water consumption-to-availability.	Brauman, K. A., Richter, B. D., Postel, S., Malsy, M., & Flörke, M. (2016). Water depletion: An improved metric for incorporating seasonal and dry-year water scarcity into water risk assessments. <i>Elem Sci Anth</i> , 4.
1.2 - Baseline Water Stress (score)	1.89	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., ... & Sutanudjaja, E.H. (2019). <i>Aqueduct 3.0: Updated decision relevant global water risk indicators</i> . Technical note. Washington, DC: World Resources Institute.

## Country Overview - Nigeria

Indicator	Value	Description	Source
1.2 - Baseline Water Stress (rank)	97	World Resources Institute's Baseline Water Stress measures the ratio of total annual water withdrawals to total available annual renewable supply, accounting for upstream consumptive use. A higher percentage indicates more competition among users.	Hofste, R., Kuzma, S., Walker, S., ... & Sutanudjaja, E.H. (2019). Aqueduct 3.0: Updated decision relevant global water risk indicators. Technical note. Washington, DC: World Resources Institute.
1.3 - Blue Water Scarcity (score)	3.60	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. <i>Science advances</i> , 2(2), e1500323.
1.3 - Blue Water Scarcity (rank)	52	The blue water scarcity risk indicator is based on Mekonnen and Hoekstra (2016) global assessment of blue water scarcity on a monthly basis and at high spatial resolution (grid cells of 30 × 30 arc min resolution). Blue water scarcity is calculated as the ratio of the blue water footprint in a grid cell to the total blue water availability in the cell. The time period analyzed in this study ranges from 1996 to 2005.	Mekonnen, M. M., & Hoekstra, A. Y. (2016). Four billion people facing severe water scarcity. <i>Science advances</i> , 2(2), e1500323.
1.4 - Projected Change in Water Discharge (by ~2050) (score)	1.64	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., ... & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. <i>Proceedings of the National Academy of Sciences</i> , 111(9), 3245-3250.
1.4 - Projected Change in Water Discharge (by ~2050) (rank)	124	This risk indicator is based on multi-model simulation that applies both global climate and hydrological models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). To estimate the change at 2°C of global warming above 1980-2010 levels, simulated annual water discharge was averaged over a 31-year period with 2°C mean warming. Results are expressed in terms of relative change (%) in probability between present day (1980-2010) conditions and 2°C scenarios by 2050.	Schewe, J., Heinke, J., Gerten, D., Haddeland, I., Arnell, N. W., Clark, D. B., ... & Gosling, S. N. (2014). Multimodel assessment of water scarcity under climate change. <i>Proceedings of the National Academy of Sciences</i> , 111(9), 3245-3250.

## Country Overview - Nigeria

Indicator	Value	Description	Source
1.5 - Drought Frequency Probability (score)	4.25	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López-Moreno, J. I. (2010). A multiscale drought index sensitive to global warming: the standardized precipitation evapotranspiration index. <i>Journal of climate</i> , 23(7), 1696-1718.
1.5 - Drought Frequency Probability (rank)	26	This risk indicator is based on the Standardized Precipitation and Evaporation Index (SPEI). Vicente-Serrano et al. (2010) developed this multi-scalar drought index applying both precipitation and temperature data to detect, monitor and analyze different drought types and impacts in the context of global warming. The mathematical calculations used for SPEI are similar to the Standard Precipitation Index (SPI), but it has the advantage to include the role of evapotranspiration.	Vicente-Serrano, S. M., Beguería, S., & López-Moreno, J. I. (2010). A multiscale drought index sensitive to global warming: the standardized precipitation evapotranspiration index. <i>Journal of climate</i> , 23(7), 1696-1718.
1.6 - Projected Change in Drought Occurrence (by ~2050) (score)	3.39	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
1.6 - Projected Change in Drought Occurrence (by ~2050) (rank)	32	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP) . A drought threshold for pre-industrial conditions was calculated based on time-series averages. Results are expressed in terms of relative change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
2.1 - Estimated Flood Occurrence (score)	3.55	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.
2.1 - Estimated Flood Occurrence (rank)	79	This risk indicator is based on the recurrence of floods within the 34-year time frame period of 1985 to 2019. The occurrence of floods within a given location was estimated using data from Flood Observatory, University of Colorado. The Flood Observatory use data derived from a wide variety of news, governmental, instrumental, and remote sensing source.	Brakenridge, G. R. (2019). Global active archive of large flood events. Dartmouth Flood Observatory, University of Colorado.

Indicator	Value	Description	Source
2.2 - Projected Change in Flood Occurrence (by ~2050) (score)	1.50	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
2.2 - Projected Change in Flood Occurrence (by ~2050) (rank)	166	This risk indicator is based on multi-model simulation that applies both global climate and drought models from the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP). The magnitude of the flood event was defined based on 100-year return period for pre-industrial conditions. Results are expressed in terms of change (%) in probability between pre-industrial and 2°C scenarios.	Frieler, K., Lange, S., Piontek, F., Reyer, C. P., Schewe, J., Warszawski, L., ... & Geiger, T. (2017). Assessing the impacts of 1.5 C global warming-simulation protocol of the Inter-Sectoral Impact Model Intercomparison Project (ISIMIP2b). Geoscientific Model Development.
3.1 - Surface Water Contamination Index (score)	3.18	<p>The underlying data for this risk indicator is based on a broad suite of pollutants with well-documented direct or indirect negative effects on water security for both humans and freshwater biodiversity, compiled by Vörösmarty et al. (2010). The negative effects are specific to individual pollutants, ranging from impacts mediated by eutrophication such as algal blooms and oxygen depletion (e.g., caused by phosphorus and organic loading) to direct toxic effects (e.g., caused by pesticides, mercury).</p> <p>The overall Surface Water Contamination Index is calculated based on a range of key pollutants with different weightings according to the level of their negative effects on water security for both humans and freshwater biodiversity: soil salinization (8%), nitrogen (12%) and phosphorus (P, 13%) loading, mercury deposition (5%), pesticide loading (10%), sediment loading (17%), organic loading (as Biological Oxygen Demand, BOD; 15%), potential acidification (9%), and thermal alteration (11%).</p>	Vörösmarty, C. J., McIntyre, P. B., Gessner, M. O., Dudgeon, D., Prusevich, A., Green, P., ... & Davies, P. M. (2010). Global threats to human water security and river biodiversity. <i>Nature</i> , 467(7315), 555.

Indicator	Value	Description	Source
3.1 - Surface Water Contamination Index (rank)	81	<p>The underlying data for this risk indicator is based on a broad suite of pollutants with well-documented direct or indirect negative effects on water security for both humans and freshwater biodiversity, compiled by Vörösmarty et al. (2010). The negative effects are specific to individual pollutants, ranging from impacts mediated by eutrophication such as algal blooms and oxygen depletion (e.g., caused by phosphorus and organic loading) to direct toxic effects (e.g., caused by pesticides, mercury).</p> <p>The overall Surface Water Contamination Index is calculated based on a range of key pollutants with different weightings according to the level of their negative effects on water security for both humans and freshwater biodiversity: soil salinization (8%), nitrogen (12%) and phosphorus (P, 13%) loading, mercury deposition (5%), pesticide loading (10%), sediment loading (17%), organic loading (as Biological Oxygen Demand, BOD; 15%), potential acidification (9%), and thermal alteration (11%).</p>	Vörösmarty, C. 4.1 - Fragmentation Status of Rivers (score)	2.74	<p>This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI &lt; 95% are considered as fragmented at a certain degree.</p>	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., ... & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. <i>Nature</i> , 569(7755), 215.
4.1 - Fragmentation Status of Rivers (rank)	86	<p>This risk indicator is based on the data set by Grill et al. (2019) mapping the world's free-flowing rivers. Grill et al. (2019) compiled a geometric network of the global river system and associated attributes, such as hydro-geometric properties, as well as pressure indicators to calculate an integrated connectivity status index (CSI). While only rivers with high levels of connectivity in their entire length are classified as free-flowing, rivers of CSI &lt; 95% are considered as fragmented at a certain degree.</p>	Grill, G., Lehner, B., Thieme, M., Geenen, B., Tickner, D., Antonelli, F., ... & Macedo, H. E. (2019). Mapping the world's free-flowing rivers. <i>Nature</i> , 569(7755), 215.
4.2 - Catchment Ecosystem Services Degradation Level (tree cover loss) (score)	1.96	<p>For this risk indicator, tree cover loss was applied as a proxy to represent catchment ecosystem services degradation since forests play an important role in terms of water regulation, supply and pollution control. The forest cover data is based on Hansen et al.'s global Landsat data at a 30-meter spatial resolution to characterize forest cover and change. The authors defined trees as vegetation taller than 5 meters in height, and forest cover loss as a stand-replacement disturbance, or a change from a forest to non-forest state, during the period 2000 – 2018.</p>	Hansen, M. C., Potapov, P. V., Moore, R., Hancher, M., Turubanova, S. A. A., Tyukavina, A., ... & Kommareddy, A. (2013). High-resolution global maps of 21st-century forest cover change. <i>science</i> , 342(6160), 850-853.

## Country Overview - Nigeria

4.3 - Projected Impacts on Freshwater Biodiversity (score)	2.87	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., ... & Hugueny, B. (2013). A scenario for impacts of water availability loss due to climate change on riverine fish extinction rates. <i>Journal of Applied Ecology</i> , 50(5), 1105-1115.
4.3 - Projected Impacts on Freshwater Biodiversity (rank)	79	The study by Tedesco et al. (2013) to project changes [% increase or decrease] in extinction rate by ~2090 of freshwater fish due to water availability loss from climate change is used as a proxy to estimate the projected impacts on freshwater biodiversity.	Tedesco, P. A., Oberdorff, T., Cornu, J. F., Beauchard, O., Brosse, S., Dürr, H. H., ... & Hugueny, B. (2013). 5.1 - Freshwater Policy Status (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.1 - Freshwater Policy Status (SDG 6.5.1) (rank)	43	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Policy" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.2 - Freshwater Law Status (SDG 6.5.1) (score)	3.00	<p>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "National Water Resources Law(s)" indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.</p> <p>For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.</p>	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.

## Country Overview - Nigeria

Indicator	Value	Description	Source
5.2 - Freshwater Law Status (SDG 6.5.1) (rank)	50	<p>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation “National Water Resources Law(s)” indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.</p> <p>For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.</p>	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
5.3 - Implementation Status of Water Management Plans (SDG 6.5.1) (score)	3.00	<p>This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation “National IWRM plans” indicator, which corresponds to one of the three national level indicators under the Enabling Environment category.</p> <p>For SDG 6.5.1, enabling environment depicts the conditions that help to support the implementation of IWRM, which includes legal and strategic planning tools for IWRM.</p>	UN Environment (2018). 6.1 - Corruption Perceptions Index (score)	4.00	<p>This risk Indicator is based on the latest Transparency International's data: the Corruption Perceptions Index 2018. This index aggregates data from a number of different sources that provide perceptions of business people and country experts on the level of corruption in the public sector.</p>	Transparency International (2019). Corruption Perceptions Index 2018. Berlin: Transparency International.
6.1 - Corruption Perceptions Index (rank)	26	<p>This risk Indicator is based on the latest Transparency International's data: the Corruption Perceptions Index 2018. This index aggregates data from a number of different sources that provide perceptions of business people and country experts on the level of corruption in the public sector.</p>	Transparency International (2019). Corruption Perceptions Index 2018. Berlin: Transparency International.
6.2 - Freedom in the World Index (score)	2.00	<p>This risk indicator is based on Freedom House (2019), an annual global report on political rights and civil liberties, composed of numerical ratings and descriptive texts for each country and a select group of territories. The 2019 edition involved more than 100 analysts and more than 30 advisers with global, regional, and issue-based expertise to covers developments in 195 countries and 14 territories from January 1, 2018, through December 31, 2018.</p>	Freedom House (2019). Freedom in the world 2019. Washington, DC: Freedom House.

## Country Overview - Nigeria

Indicator	Value	Description	Source
6.2 - Freedom in the World Index (rank)	90	This risk indicator is based on Freedom House (2019), an annual global report on political rights and civil liberties, composed of numerical ratings and descriptive texts for each country and a select group of territories. The 2019 edition involved more than 100 analysts and more than 30 advisers with global, regional, and issue-based expertise to covers developments in 195 countries and 14 territories from January 1, 2018, through December 31, 2018.	Freedom House (2019). Freedom in the world 2019. Washington, DC: Freedom House.
6.3 - Business Participation in Water Management (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Business Participation in Water Resources Development, Management and Use" indicator, which corresponds to one of the six national level indicators under the Institutions and Participation category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
6.3 - Business Participation in Water Management (SDG 6.5.1) (rank)	52	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Business Participation in Water Resources Development, Management and Use" indicator, which corresponds to one of the six national level indicators under the Institutions and Participation category.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
7.1 - Management Instruments for Water Management (SDG 6.5.1) (score)	3.00	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Sustainable and efficient water use management" indicator, which corresponds to one of the five national level indicators under the Management Instruments category.  For SDG 6.5.1, management instruments refer to the tools and activities that enable decision-makers and users to make rational and informed choices between alternative actions.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
7.1 - Management Instruments for Water Management (SDG 6.5.1) (rank)	36	This risk indicator is based on SDG 6.5.1. Degree of IWRM Implementation "Sustainable and efficient water use management" indicator, which corresponds to one of the five national level indicators under the Management Instruments category.  For SDG 6.5.1, management instruments refer to the tools and activities that enable decision-makers and users to make rational and informed choices between alternative actions.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.

## Country Overview - Nigeria

Indicator	Value	Description	Source
7.2 - Groundwater Monitoring Data Availability and Management (score)	3.00	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMM Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.2 - Groundwater Monitoring Data Availability and Management (rank)	37	This risk indicator is based on the data set by UN IGRAC (2019) to determine the level of availability of groundwater monitoring data at country level as groundwater management decisions rely strongly on data availability. The level of groundwater monitoring data availability for groundwater management is determined according to a combination of three criteria developed by WWF and IGRAC: 1) Status of country groundwater monitoring programme, 2) groundwater data availability for NGOs and 3) Public access to processed groundwater monitoring data.	UN IGRAC (2019). Global Groundwater Monitoring Network GGMM Portal. UN International Groundwater Resources Assessment Centre (IGRAC).
7.3 - Density of Runoff Monitoring Stations (score)	2.38	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km <sup>2</sup> of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
7.3 - Density of Runoff Monitoring Stations (rank)	149	The density of monitoring stations for water quantity was applied as proxy to develop this risk indicator. The Global Runoff Data Base was used to estimate the number of monitoring stations per 1000km <sup>2</sup> of the main river system (data base access date: May 2018).	BfG (2019). Global Runoff Data Base. German Federal Institute of Hydrology (BfG).
8.1 - Access to Safe Drinking Water (score)	4.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.1 - Access to Safe Drinking Water (rank)	21	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.2 - Access to Sanitation (score)	5.00	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.

## Country Overview - Nigeria

Indicator	Value	Description	Source
8.2 - Access to Sanitation (rank)	10	This risk indicator is based on the Joint Monitoring Programme for Water Supply, Sanitation and Hygiene (UNICEF/WHO) 2019 data. It provides estimates on the use of water, sanitation and hygiene by country for the period 2000-2017.	WHO & UNICEF (2019). Estimates on the use of water, sanitation and hygiene by country (2000-2017). Joint Monitoring Programme for Water Supply, Sanitation and Hygiene.
8.3 - Financing for Water Resource Development and Management (SDG 6.5.1) (score)	3.00	This risk indicator is based on the average 'Financing' score of UN SDG 6.5.1. Degree of IWRM Implementation database. UN SDG 6.5.1 database contains a category on financing which assesses different aspects related to budgeting and financing made available and used for water resources development and management from various sources.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
8.3 - Financing for Water Resource Development and Management (SDG 6.5.1) (rank)	73	This risk indicator is based on the average 'Financing' score of UN SDG 6.5.1. Degree of IWRM Implementation database. UN SDG 6.5.1 database contains a category on financing which assesses different aspects related to budgeting and financing made available and used for water resources development and management from various sources.	UN Environment (2018). Progress on integrated water resources management. Global baseline for SDG 6 Indicator 6.5.1: degree of IWRM implementation.
9.1 - Cultural Diversity (score)	5.00	Water is a social and cultural good. The cultural diversity risk indicator was included in order to acknowledge that businesses face reputational risk due to the importance of freshwater for indigenous and traditional people in their daily life, religion and culture. This risk indicator is based on Oviedo and Larsen (2000) data set, which mapped the world's ethnolinguistic groups onto the WWF map of the world's ecoregions. This cross-mapping showed for the very first time the significant overlap that exists between the global geographic distribution of biodiversity and that of linguistic diversity.	Oviedo, G., Maffi, L., & Larsen, P. B. (2000). Indigenous and traditional peoples of the world and ecoregion conservation: An integrated approach to conserving the world's biological and cultural diversity. Gland: WWF (World Wide Fund for Nature) International.
9.1 - Cultural Diversity (rank)	2	Water is a social and cultural good. The cultural diversity risk indicator was included in order to acknowledge that businesses face reputational risk due to the importance of freshwater for indigenous and traditional people in their daily life, religion and culture. This risk indicator is based on Oviedo and Larsen (2000) data set, which mapped the world's ethnolinguistic groups onto the WWF map of the world's ecoregions. This cross-mapping showed for the very first time the significant overlap that exists between the global geographic distribution of biodiversity and that of linguistic diversity.	Oviedo, G., Maffi, L., & Larsen, P. B. (2000). Indigenous and traditional peoples of the world and ecoregion conservation: An integrated approach to conserving the world's biological and cultural diversity. Gland: WWF (World Wide Fund for Nature) International.
10.1 - Freshwater Endemism (score)	2.79	The underlying data set for this risk indicator comes from the Freshwater Ecoregions of the World (FEOW) 2015 data developed by WWF and TNC. Companies operating in basins with higher number of endemic fish species are exposed to higher reputational risks.	WWF & TNC (2015). Freshwater Ecoregions of the World.

## Country Overview - Nigeria

Indicator	Value	Description	Source
10.1 - Freshwater Endemism (rank)	146	The underlying data set for this risk indicator comes from the Freshwater Ecoregions of the World (FEOW) 2015 data developed by WWF and TNC. Companies operating in basins with higher number of endemic fish species are exposed to higher reputational risks.	WWF & TNC (2015). Freshwater Ecoregions of the World.
10.2 - Freshwater Biodiversity Richness (score)	4.74	The underlying data set for this risk indicator comes from the Freshwater Ecoregions of the World (FEOW) 2015 data developed by WWF and TNC. Count of fish species is used as a representation of freshwater biodiversity richness. Companies operating in basins with higher number of fish species are exposed to higher reputational risks.	WWF & TNC (2015). Freshwater Ecoregions of the World.
10.2 - Freshwater Biodiversity Richness (rank)	35	The underlying data set for this risk indicator comes from the Freshwater Ecoregions of the World (FEOW) 2015 data developed by WWF and TNC. Count of fish species is used as a representation of freshwater biodiversity richness. Companies operating in basins with higher number of fish species are exposed to higher reputational risks. ## Country Aspects

### 1. PHYSICAL ASPECTS

#### 1.1. WATER RESOURCES

##### 1.1.1. WATER RESOURCES

Nigeria is well drained, with a close network of rivers and streams. Some of these, particularly the smaller ones in the north, are seasonal. There are four principal surface water basins in Nigeria:

-The Niger basin has an area of 584,193km<sup>2</sup> within central and northwestern Nigeria, covering 63 per cent of the total area of the country. The most important rivers in the basin are the Niger and its tributaries the Benue, the Sokoto the and Kaduna;

-The Lake Chad basin in the northeast with an area of 179,282km<sup>2</sup>, or 20 per cent of the total area of Nigeria, is the only internal drainage basin in the country. Important rivers are the Komadougou Yobe and its tributaries the Hadejia, the Jama'are and the Komadougou Gena;

-The southwestern littoral basins have an area of 101,802km<sup>2</sup>, which is 11 per cent of the country's total area. The rivers originate in the hilly areas to the south and west of the Niger River;

-The southeastern littoral basins have an area of 58,493km<sup>2</sup>, which is 6 per cent of the total area of the country. Their major watercourses are the Cross and Imo Rivers and they receive much of their runoff from the plateau and mountain areas along the Cameroon border.

Nigeria has extensive groundwater resources, located in eight recognized hydrogeological areas and local groundwater in shallow alluvial (fadama) aquifers adjacent to major rivers:

-The Sokoto basin zone comprises sedimentary rocks in northwest Nigeria. Yields range from below 1.0 to 5.0L/s;

-The Chad basin zone comprises sedimentary rocks. There are three distinct aquifer zones: upper, middle and lower. Borehole yields are about 1.2 to 1.6L/s from the upper unconfined aquifer and 1.5 to 2.1L/s from the middle aquifer;

-The middle Niger basin zone comprises sandstone aquifers yielding between 0.7 and 5.0L/s and the Alluvium in the Niger Valley yielding between 7.5 and 37.0L/s;

-The Benue basin zone is the least exploited basin in Nigeria, extending from the Cameroon border to the Niger-Benue confluence. The sandstone aquifers in the area yield between 1.0 and 8.0L/s.

-The southwestern zone comprises sedimentary rocks bounded in the south by the coastal Alluvium and in the north by the basement complex;

-The south-central zone is made up of cretaceous and tertiary sediments centred on the Niger Delta. Yields are from 3.0 to 7.0L/s;

-The southeastern zone comprises cretaceous sediments in the Anambra and Cross River basins. Borehole numbers are low due to abundant surface water resources;

-The basement complex comprises over 60 per cent of the country's area. It consists of low permeability rocks and groundwater occurs in the weathered mantle and fracture zones with yields of between 1.0 and 2.0L/s.

Lake Chad is an important wetland lying in the semi-arid Sahel corridor. With a mean depth of 3.9m, its surface area is highly variable, ranging from a minimum of 2,000km<sup>2</sup> in 1907 to a maximum of 22,000km<sup>2</sup> in 1961.

Low-lying areas flooded during the wet season, known as fadama areas, are scattered across the ecological zones of Guinea Savanna, Sudan Savanna, and the Sahel. These diverse wetlands are valuable for grazing, agriculture, and other municipal uses, and are deemed of international importance as breeding grounds for migratory birds.

Nigeria's total annual renewable water resources are estimated at 286.2km<sup>3</sup>. Annual internally produced resources amount to 221km<sup>3</sup>, made up of 214km<sup>3</sup> surface water and 87km<sup>3</sup> groundwater. Around 80km<sup>3</sup> of the latter is assumed to be overlap between surface and groundwater. External water resources are estimated at 65.2km<sup>3</sup>/yr, including surface water from Niger, Cameroon and Benin. Exploitable surface water resources are estimated to be 80 per cent of the natural flow, which is about 96km<sup>3</sup>/yr. Annual extractable groundwater resources are about 59.51km<sup>3</sup>, distributed as follows: 10.27km<sup>3</sup> in northern Nigeria; 25.48km<sup>3</sup> in the middle belt; 23.76km<sup>3</sup> in the south. Dam capacity is estimated to be 44.2km<sup>3</sup>.

##### 1.1.2. WATER USE

Total annual water withdrawal was estimated to be 8km<sup>3</sup> in 2000. Agriculture was the biggest water user with 5.5km<sup>3</sup>, or 69 per cent of the total water withdrawal, followed by municipalities with about 1.7km<sup>3</sup> (21 per cent) and industry with 0.8km<sup>3</sup> (10 per cent)

#### 1.2. WATER QUALITY, ECOSYSTEMS AND HUMAN HEALTH

Major environmental problems in Nigeria include: soil degradation; rapid deforestation; urban air and water pollution; desertification; oil pollution – water, air and soil have suffered serious damage from oil spills; loss of arable land; and rapid urbanization.

In the past, no serious attention was paid to environmental considerations in the planning and implementation of water resources development projects, resulting in environmental damage. Hydrology downstream from dams and major diversions and pumping stations have been modified, especially in the north. Extensive areas of fadama, fisheries and wildlife habitats were wiped out. It is however encouraging that the functions of the Department of Irrigation and Drainage were modified to include environmental impact assessments.

The Hadejia Nguru Wetlands in the northeast of the country receive their water from the Hadejia and Jama'are Rivers, which meet to form the Komadougou Yobe River, flowing northeast into Lake Chad. So far, more than half of the wetlands have been lost due to drought and upstream dams. It

is feared that new development projects could divert still more water from the wetlands for irrigated agriculture in upstream areas. Apart from the ecology, such developments would also negatively affect irrigated agricultural production in the floodplain using water from the shallow groundwater aquifer, as recharging would decrease further.

Expansion of irrigated crop production in the fadama lands has led to a lowering of the water table in some areas. There is a need for detailed aquifer assessments before installing more pumps.

In the Niger Delta, oil exploration activities such as oil drilling and pipe leakages are polluting water resources.

## 2. GOVERNANCE ASPECTS

### 2.1. WATER INSTITUTIONS

The Federal Ministry of Water Resources (FMWR) is the main national coordinating body in the water sector. Its principal functions are to:

- Formulate and implement national irrigation policy;
- Develop and support irrigated agriculture;
- Coordinate the development and utilization of water resources for irrigation and other purposes;
- Update and implement the Water Resources Master Plan;
- Collect, store, analyze and disseminate hydro-meteorological, hydrological and other data;
- Support, monitor and evaluate programmes and performances of the River Basin Development Authorities (RBDA) and the National Water Resources Institute (NWRI);
- Formulate appropriate water resources legislation;
- Undertake studies and investigations to allow the efficient use of Nigeria's water resources.

Four of FMWR's eight departments are directly concerned with irrigation matters:

- The Department of Irrigation and Drainage (DID); among its major responsibilities is the supervision and monitoring of the RBDAs;
- The Department of Planning, Research and Statistics;
- The Department of Hydrology and Hydrogeology;
- The Department of Dams and Reservoir Operations.

Other federal institutions involved in irrigation are:

- The National Council of Water Resources (NCWR) is the most important water resources policy-formulating body.
- The National Technical Committee on Water Resources (NTCWR) is a sub-committee of the NCWR. The NTCWR has five specialist sub-committees that are important for information exchanges between federal and state level agencies: dams, water supply, irrigation and drainage, hydrology and hydrogeology, and manpower.
- The Federal Ministry of Agriculture and Rural Development was involved in irrigation development in the past as it funded, with World Bank support, a series of state-run Agricultural Development Projects, including the promotion of irrigation owned and managed by the farmer, particularly in fadama areas, and the provision of extension services to the public sector irrigation schemes of

the RBDAs and the State Irrigation Departments.

-The River Basin Development Authorities (RBDAs) are the main bodies in charge of administering and developing Nigeria's water resources and are responsible for public sector irrigation at the federal level. They were established in the mid-1970s. Their areas of operation are determined by the extent of the river basins they serve. The RBDAs were favourably financed until the end of the oil boom, when their scope and autonomy became limited.

State agencies involved in irrigation are:

- The State Ministries of Agriculture. They were responsible for irrigation development before RBDAs were established. Irrigation responsibility within the Ministries is with the State Irrigation Departments (SID). In most states they are small and suffer from funding constraints and lack of staff and capability to design, implement and monitor irrigation schemes. Their programmes consist more of plans than actual irrigation development, which in 2004 amounted to 122km<sup>2</sup>, of which about 67km<sup>2</sup> is actually irrigated. The informal division within a state is that schemes larger than 2km<sup>2</sup> are handled by the RBDA concerned.
- State Ministries of Water Resources exist in some states, and where they exist the SID has been transferred to them.
- The Agricultural Development Projects (ADPs). They became involved in irrigation in the early 1980s, mainly in small-scale fadama development. In most states, they are responsible for extension services.
- Local government authorities are involved in irrigation in some limited instances by making small pumps available to farmers for fadama-type irrigation.

### 2.2. WATER MANAGEMENT

Semi-autonomous project management units manage federally-owned and funded irrigation schemes. These units usually consist of 3-4 departments such as irrigation, agriculture, accounts, stores and workshops. A project manager who reports directly to the managing director of the RBDA concerned heads the units.

Government policy is to subdivide schemes along the lines of one Water User Association (WUA) per distribution canal; thus, a WUA comprises 10-25 farmers. Responsibilities include operation and maintenance of the canal and its structure and adherence to water scheduling programmes. A scheme management committee, for which each WUA elects a representative, then acts as the interface between the WUAs and RBDA or other authorities. Currently WUAs are being established in two RBDA schemes and their activities include the desilting of distribution, tertiary canals and the collection of water charges.

The National Fadama Development Project resulted in the formation of more than 9,000 Fadama User Associations. Most were formed with assistance from ADP staff and require further assistance and capacity building to face the challenges of operating and maintaining their schemes.

### 2.3. WATER POLICY AND LEGAL FRAMEWORK

Water legislation in Nigeria is use-oriented and deals with navigability, shipping and municipal use; navigability and confusion over the legal ownership of water as a resource can impede irrigation development. Decentralization is the defining feature of water administration in Nigeria, leading to different ministries and agencies at different levels administering laws without adequate coordination.

The functions of the RBDAs related to irrigation are defined in the River Basin Development Authorities Act No. 35 of 1986.

The Environmental Impact Assessment Decree No. 86 of 1992 lists drainage and irrigation as a mandatory study activity, thus prescribing that environmental impact assessments are to be carried out for irrigation projects.

The Water Resources Decree No. 101 of 1993 gives the FMWR significant power to control and coordinate activities for proper watershed management and resources protection and for public administration of water resources. It confers to the FMWR the responsibility to make proper provision for adequate supplies of suitable water for, among others, agricultural purposes in general and irrigation in particular.

The Food and Agriculture Organization of the United Nations is updating Nigeria's 1995 irrigation policy. The second draft in 2000 provides for:

- Being responsive to macro-economic drivers, commodity prices and input costs;
- Sustainable operation, maintenance and management (including cost recovery);
- Better integration with agricultural production systems;
- Support services in irrigated agriculture including credit facilities, fertilizer, seeds and machinery. However, it includes access to land and water with "support services" when this should be a separate category;
- Formation of WUAs – confirmation of legal status, training and transfer of operation and maintenance of some levels of the irrigation systems when WUAs are ready;
- Advice on on-farm water management;
- Research on irrigation including technology, environmental conservation, economics, sociology, health links and preservation techniques;
- Marketing strategies including a government commitment to building rural roads, small-scale food processing, storage and price guarantees.

### 3. GEOPOLITICAL ASPECTS

Nigeria is a member of two regional authorities dealing with the management of shared water resources:

-The Niger Basin Authority was formed in 1964 and is made up of the nine countries that share the basin (Guinea, Côte d'Ivoire, Mali, Burkina Faso, Algeria, Benin, Niger, Chad and Cameroon). The authority's main aim is to ensure the integrated development of the basin.

-The Lake Chad Basin Commission comprises representatives of Cameroon, Central African Republic, Chad, Niger and Nigeria. Its objective is to ensure rational and equitable development of the Lake Chad region's natural resources, including water.

In addition, by signing the Maiduguri Agreement in 1990, Niger and Nigeria have established a joint commission to monitor and assess development options, in particular water resources development, in the four major sub-basins common to the two countries. However, implementation of the agreement has been ineffective so far.
